Water Fluoridation: Physiological effects of Ingested Fluoride-Mitigation and Management
By
Dr. Shubhangi Tripathi

Water fluoridation is the controlled adjustment of fluoride to a public water supply solely to reduce tooth decay. Fluoridated water contains fluoride at a level that is effective for preventing cavities; this can occur naturally or by adding fluoride. Fluoridated water operates on tooth surfaces: in the mouth, it creates low levels of fluoride in saliva, which reduces the rate at which tooth enamel demineralizes and increases the rate at which it remineralizes in the early stages of cavities. **Typically a fluoridated compound is added to drinking water.** Defluoridation is needed when the naturally occurring fluoride level exceeds recommended limits. In 2011, the World Health Organization suggested a level of fluoride from 0.5 to 1.5 mg/L, depending on climate, local environment, and other sources of fluoride. Bottled water typically has unknown fluoride levels.

Tooth decay remains a major public health concern in most industrialized countries, affecting 60–90% of schoolchildren and the vast majority of adults. Water fluoridation reduces cavities in children, while efficacy in adults is less clear. Most European countries have experienced substantial declines in tooth decay, though milk and salt fluoridation is widespread in lieu of water fluoridation.

Although fluoridation can cause dental fluorosis, which can alter the appearance of developing teeth or enamel fluorosis, the differences are mild and usually not an aesthetic or public health concern. There is no clear evidence of other side effects from water fluoridation. Fluoride's effects depend on the total daily intake of fluoride from all sources. Drinking water is typically the largest source; other methods of fluoride therapy include fluoridation of toothpaste, salt, and milk. The **World Health Organization** reports that water fluoridation, when feasible and culturally acceptable, has substantial advantages, especially for subgroups at high risk, while the European Commission finds no benefit to water fluoridation compared with topical use.

सोन नदी में नाव से बालू निकाले समय मजदूर गिरा, शव की खोज जारी
नवविहार दूत संवाददाता
बनारस: बनारस शहर के भीरवाही गांव के समीप सोन नदी में नाव से बालू निकाले समय मजदूर का गिरा। लखनऊ मजदूर की सूचना मिलते ही परिजनों का रो-री का दृश्य हासल है। लखनऊ मजदूर के बारे में बताया जाता है कि वह खादिकपुर निवासी लखनऊ महती का 38 वर्षीय पुत्र दशरथ महती है। प्रतिदिन की तरह ये आज भी मजदूरी करने नाव पर गया था।

अभी तक सोन नदी में दशरथ महती का कोई अंदा पता नहीं चल पाया है। बताया चले कि इस तरह की घटना सोन नदी और गंगा नदी में बराबर घटती रहती है। परंतु अभी तक इन नदियों में अपैथ करण से बालू बुल्डोज का काम नावों के ड्राफ्ट बढ़ाने से किया जाता रहा है। अब तक सोन नदी में नावों का संपूर्ण पंजीयन नहीं हो पाया है। बिहार रजिस्ट्रेशन के लोग अपनी नाव बालू लखनऊ नदियों में चलाने हैं और आप् दिन इस तरह की दुर्घटनाएं होती रहती हैं।

कई लोग नाव का दुर्घटना में अपनी जानें संभाल चुके हैं। प्रशासन अब तक नाव है। इससे अपैथ बालू खननकर्ताओं का मनोबल बढ़ता जा रहा है और इस तरह से नाव की दुर्घटनाएं होती रही है। किसी प्रकार का कोई अंकुश नहीं रहने के कारण नाव चलानेक बढ़ाने से नाव नदियों में चला रहे हैं।
